

NATURALLY SUCCESSFUL

Simply everything is right with the packaging made by Omni-Pac. Even the ecological end result since our moulded fibre products are manufactured from wood pulp and/or waste paper. Wood pulp is derived from weak wood that becomes available in great amounts when the nordic forests are thinned out. Together with waste paper this renewable natural material can be processed into stable and hygienic packaging. Simply a traditional raw material with a future.

OUR PACKAGING GOES IN CIRCLES

With us everything is going round and we can be proud of it. There is a simple reason for it - after use our packaging can be completely recycled in two different ways.

The small cycle:

Simply dispose of the products together with waste paper and directly after recycling it can be reprocessed.

The big cycle:

The packaging is composted. After some time this biodegradable material becomes valuable humus and, therefore, can be consigned again to the ecological cycle.

AN ABSOLUTELY POSITIVE END RESULT

In addition to the economical advantages of our packaging there are numerous ecological assets which complete a perfect solution:

- * renewable raw materials
- * closed water circulation with biological water treatment
- * no "harmful" additives (suitable for foodstuffs products)
- * trouble-free disposal of the Omni-Pac moulded fibre products through paper recycling or composting
- * regular environment audits according to the American "SOPI" concern regulations
- * continuous risk analyses
